# 1 Abstract Slots

This section describes the possible domains, intentions and slots that are available from NCS cloud. The examples shown are to give an idea of the possible functionality and may not necessarily work in your specific project. Feature availability depends on the configuration of your project along with the *clientstate* provided in the client request. Note all domains, intentions and slots mentioned in this document may not be available in all languages. English examples are shown in this document for brevity, when possible. For examples from other languages, please contact your Nuance representative.

Note that only slots that are documented here should be utilized. At times, undocumented slots may appear in the results from the system. These are experimental, not guaranteed to be accurate and subject to change. They should not be utilized.

The format of the abstract slots is as follows. Please see **Abstract NLU format [1]** documentation for more details.

```
actions": [
  {
    "Input": "...",
    "Instances": [
      {
        "nlu_classification" : {
          "Domain" : "...",
          "Intention" : "...",
          "Mode" : "..."
        },
        "nlu_slot_details" : {
          "<slot_key>" : "...",
        }
      },
      ...
    ],
    "type": "nlu_results"
  },
  ...
]
```

## 1.1 Domain: Music

## 3.2 <Date> Specification & Example

The date is in a String with a specific syntax. The date includes one or more attribute-value pairs covering absolute and or relative date information:

```
multientity_ ;min-entities=1;dayNum= ( (0)?[1-9] | [12] [0-9] | 3[01] );weekday=(monday|tuesday|wednesday|thursday|friday|saturday|sunday);month=(january|february|march|april|may|june|july|august|september|october|november|december);year=[0-9]{4};d=(-)?[0-9]+;w=(-)?[0-9]+;m=(-)?[0-9]+;y=(-)?[0-9]+;weekend=(-)?[0-9]+;modifierWeek=(first|second|third|fourth|last|beginning|end);modifierMonth=(first|second|third|fourth|last|beginning|end);
```

Multiple attribute-value pairs are separated by space “ ”.

The following are attributes with absolute values:

- dayNum
  - Models the date number in a month; proper values are {01...09,10...19,20...29,30..31}
  - Example: “dayNum=11” for the 11th of the month
- weekday
  - Models the day of the week
  - Example: “weekday=monday” to indicate Monday
- month
  - Models the month
  - Example: “month=october” to indicate October, “dayNum=23 month=november” to indicate November 23
- year
  - Models the year as a four-digit number
  - Example: “year=2014” to indicate the year 2014

The following are attributes with relative values

- d
  - Relative day, minus for past, (implicit) plus for future, with a range of -/+ 0-9 days. 0 is today.
  - Example: “d=2” indicates the day after tomorrow, “d=-1” indicates yesterday
- w
  - Relative week, minus for past, (implicit) plus for future, with a range of -/+ 0-9 weeks. 0 is this week.
  - Example: “w=2” indicates two weeks from now, “w=-1” indicates last week
- weekend
  - Relative weekend, minus for past, (implicit) plus for future, with a range of -/+ 0-9 weekends. 0 is this weekend.
  - Example: “w=1” indicates next weekend, “w=-1” indicates last weekend
- m
  - Relative month, minus for past, (implicit) plus for future, with a range of -/+ 0-9 months. 0 is this month.
  - Example: “m=1” indicates next month, “m=-1” indicates last month
- y
  - Relative year, minus for past, (implicit) plus for future, with a range of -/+ 0-9 years. 0 is this year.
  - Example: “y=2” indicates in two years from now, “y=-1” indicates last year
- modifierWeek
  - Explicit qualifier of the week, possible values are {first|second|third|fourth|last|beginning|end}
  - Example: “modifierWeek=last” indicates last week, “modifierWeek=beginning” is beginning of the week, “modifierWeek=beginning w=1” indicates the beginning of next week
- modifierMonth
  - Explicit qualifier of the month, possible values are {first|second|third|fourth|last|beginning|end}
  - Example: “modifierMonth=last” indicates last month, “modifierMonth=beginning” is beginning of the month, “modifierMonth=beginning m=1” indicates the beginning of next month

Example:

Date	Meaning
dayNum=23 month=november	November, 23
dayNum=11 month=october year=2014	October 11, 2014
modifierWeek=beginning m=1	beginning of next month

### 3.3 <Time> Specification & Example

The time is in a String with a specific syntax:

```
(\[+[0-9][0-9]:[0-9][0-9]:[0-9][0-9]|(2[0-3]|[0-1][0-9])[[:?]][0-5][0-9](:[0-5][0-9])?)|morning|afternoon|evening|night
```

The time may yield a value in a time range or in one of four periods of the day: morning, afternoon, evening, night.

The time range is from “00:00” to “23:59”

If there is a question mark (?) between the hour and minute digits, there is no resolution of AM/PM. This must be interpreted at the client level.

If a leading plus (+) is added in front, this refers to a relative time in the future compared with the current time. The absence of the plus refers to an absolute time during the day. The range of the future time is from “00:00:00” to “99:99:99”

Example:

Date	Meaning
06:00	6:00 AM
18:00	6:00 PM
06?00	6 o'clock (with no reference to AM or PM)
+08:00:00	8 hours in the future based on the current time
evening	Evening time period
